1 My Awesome Jupyter Notebook

In a Jupyter notebook, there are different kinds of "cells". This cell consists of *fancy* Markdown text.

There are also "code" cells. Jupyter notebooks use Python by default, but they also support over 40 other languages (including R).

The code cells below are running in Python:

```
[1]: 2+2
```

```
[1]: 4
```

```
[2]: goals = ['Study data science.', 'Find some data.',
             'Run some algorithms.', 'Profit!']
     for i, goal in enumerate(goals):
         print ("Goal #{iteration}: {goal}".format(iteration = i + 1, goal = goal))
```

```
Goal #1: Study data science.
Goal #2: Find some data.
Goal #3: Run some algorithms.
Goal #4: Profit!
```
